DETAILED ACTION***Double Patenting***

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory obviousness-type double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent either is shown to be commonly owned with this application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement.

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 1-2, 9-10, and 17-18 are rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-2 and 7 of U.S. Patent No. 6,928,377. Although the conflicting claims are not identical, they are not patentably distinct from each other because a self test and a BIST would be obvious variations of the same invention, counting the number of unique failing row addresses of the tested data column is effectively the same as counting the number of failing cycles, performing a row test or a column test would be another variation of the same invention. each unique failing row address is stored, a counter is enabled to count the number of unique failing row addresses for the unmasked data column, and at the end of testing of the unmasked data column, if the error count value for the unmasked data column

Art Unit: 2138

exceeds a previously stored high error count value from previously tested data columns, then the unmasked data column is determined to be the worst data column so far, and the error count value for the unmasked data column is stored in an error count register, and a bit-address for the unmasked data column is stored in a repair register is the same as collecting the data and storing it elsewhere. Further using a multiplexor is an art recognized equivalent of a selector.

Allowable Subject Matter

Claims 3-8, 11-16, and 19-20 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
